## Discussion Question: Factorial Two Ways

---

Rewrite `fact(n)` so that the result of `fact(5)` is computed using the following steps:

```
5 (1 * 5)
20 (1 * 5 * 4)
60 (1 * 5 * 4 * 3)
120 (1 * 5 * 4 * 3 * 2)
```

```
def fact(n):
    """Compute n factorial.
```

```
>>> fact(5)
```

```
120
```

```
>>> fact(0)
```

```
1
```

```
"""
```

```
if n == 0 or n == 1:
```

```
    return 1
```

```
else:
```

```
    return fact(n-1) * n
```

This version computes `fact(5)` by these steps:

```
2 (1 * 2)
```

```
6 (1 * 2 * 3)
```

```
24 (1 * 2 * 3 * 4)
```

```
120 (1 * 2 * 3 * 4 * 5)
```

## Self-Reference

## Returning a Function Using Its Own Name

```

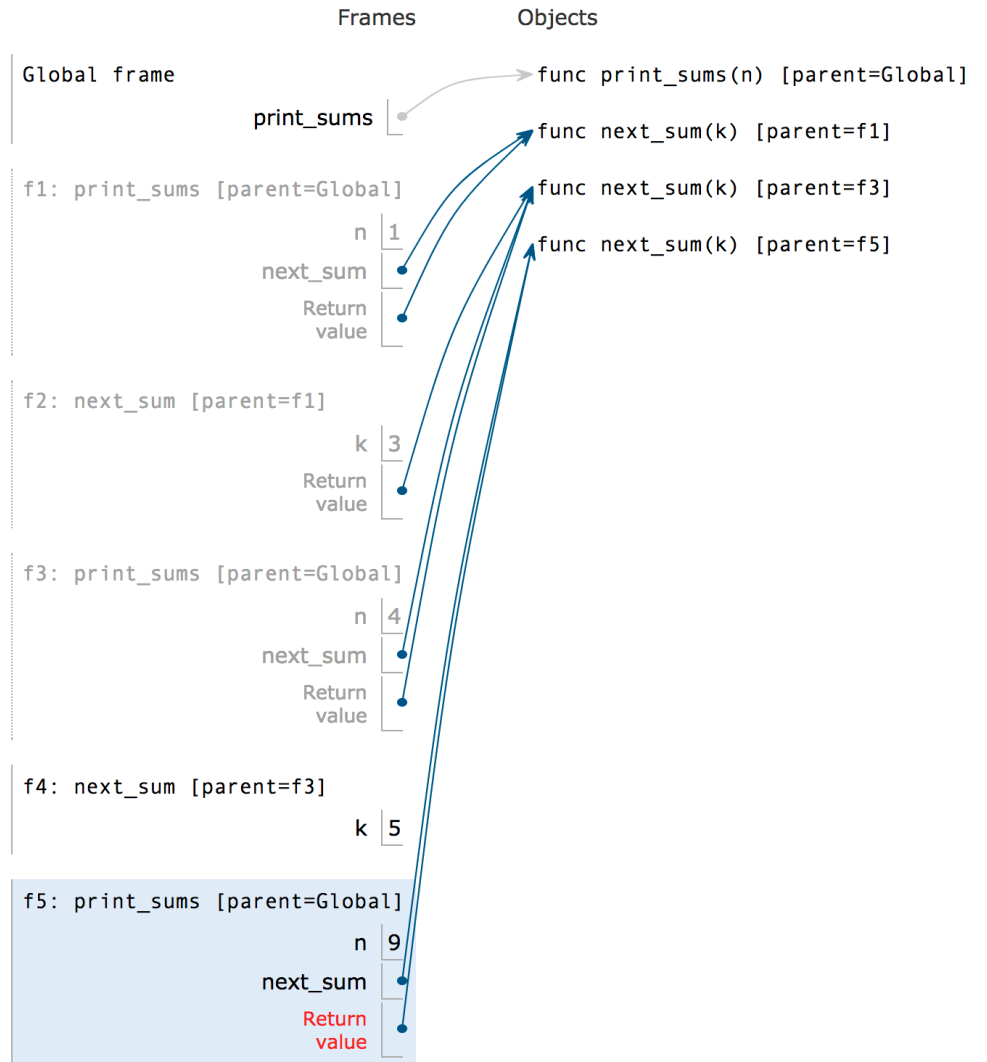

1  def print_sums(n):
2      print(n)
3      def next_sum(k):
4          return print_sums(n+k)
5      return next_sum
6
7  print_sums(1)(3)(5)

```

`print_sums(1)(3)(5)` prints:

$$\begin{array}{l} 1 \\ 4 \quad (1 + 3) \\ 9 \quad (1 + 3 + 5) \end{array}$$

`print_sums(3)(4)(5)(6)` prints:

$$\begin{array}{l} 3 \\ 7 \quad (3 + 4) \\ 12 \quad (3 + 4 + 5) \\ 18 \quad (3 + 4 + 5 + 6) \end{array}$$

## Example: Add Up Some Numbers (Fall 2016 Midterm 1 Question 5)

Implement `add_up`, which takes a positive integer `k`. It returns a function that can be called repeatedly `k` times, one integer argument at a time, and returns the sum of these arguments after `k` repeated calls.

```
def add_up(k):
```

""Add up k numbers after k repeated calls.

`add_up(4)(10)` returns a one-arg function & needs to remember 3 & 10

```
>>> add_up(4)(10)(20)(30)(40) # Add up 4 numbers: 10 + 20 + 30 + 40
100
"""
add_up(4) returns a one-arg function & needs to remo
```

`add_up(4)` returns a one-arg function & needs to remember the 4

```
assert k > 0
def f(n):
    if k == 1:
        return n
    else:
        return f(n-1)
return f
```

```
else:
    return lambda t: add_up(k - 1) (n + t)
```

Evaluates to a one-arg function that  
adds  $k-2$  more numbers to  $n + t$

## Converting Iteration to Recursion

## Discussion Question: Play Twenty-One

Rewrite play as a recursive function without a while statement.

- Do you need to define a new inner function? Why or why not? If so, what are its arguments?
- What is the base case and what is returned for the base case?

```
def play(strategy0, strategy1, goal=21):  
    """Play twenty-one and return the winner.
```

```
>>> play(two_strat, two_strat)
```

```
1
```

```
"""
```

```
n = 0
```

```
who = 0 # Player 0 goes first
```

```
while n < goal:
```

```
    if who == 0:
```

```
        n = n + strategy0(n)
```

```
        who = 1
```

```
    elif who == 1:
```

```
        n = n + strategy1(n)
```

```
        who = 0
```

```
return who
```

```
def play(strategy0, strategy1, goal=21):  
    """Play twenty-one and return the winner.
```

```
>>> play(two_strat, two_strat)
```

```
1
```

```
"""
```

```
def f(n, who):
```

```
    if n >= goal:
```

```
        return who
```

```
    if who == 0:
```

```
        n = n + strategy0(n)
```

```
        who = 1
```

```
    elif who == 1:
```

```
        n = n + strategy1(n)
```

```
        who = 0
```

```
    return f(n, who)
```

```
return f(0, 0)
```
